Portfolio — case studies with video walkthroughs of the work below: purzycki.pl

SUMMARY

Full-stack engineer with a front-end focus and eleven years in web development: four in **React and Next.js** with TypeScript, seven before that as a **full-stack WordPress developer**. At Talksome, **sole frontend developer** on two live cloud telephony products — a Next.js administration platform and a real-time WebRTC agent console — and on the **OAuth 2.0 / OIDC sign-in service** both now use, built from an empty repository. Owned component architecture, API integration, testing and release. Outside work, built and deployed **Recast**, a full-stack Next.js app on Postgres and the Claude API, from schema to CI/CD on Google Cloud Run. The WordPress years, at agencies and freelance, covered dozens of sites taken from design to deployment: custom themes and plugins in PHP and MySQL, responsive frontends built from Figma, XD and Photoshop.

KEY SKILLS

Core:	TypeScript, JavaScript (ES6+), HTML5, CSS3, SQL, PHP
Front-End:	React 19, Next.js 16 (App Router, Server Components, server-side rendering / SSR), Vue 3, Nuxt
State & Data:	Redux Toolkit, RTK Query, normalised state models, REST APIs, GraphQL
Backend:	Node.js, Next.js server actions and route handlers, PostgreSQL, Prisma, Zod
Auth:	OAuth 2.0 / OIDC, single sign-on (SSO), multi-factor authentication (MFA, TOTP), Ory Hydra and Kratos, Auth.js
Real-time:	WebRTC/SIP, XMPP, RxJS, Electron
Styling & UI:	Tailwind CSS, SCSS, CSS custom properties, vanilla-extract, Material UI, Chakra UI, design systems
Testing:	Cypress (end-to-end / E2E and visual regression), Playwright, Vitest, React Testing Library
Build & CI/CD:	Git, Docker, GitHub Actions, GitLab CI, Google Cloud Run, Vite, Webpack, ESLint, Prettier
Process:	Agile / Scrum, Jira, code review, working with product and backend in a distributed team
AI:	Claude API (structured output, streaming), Claude Code in daily work
Also:	accessibility (WCAG, keyboard operability), i18n, WordPress, Figma, Adobe XD

EXPERIENCE

Frontend Developer — [Talksome](#) Jul 2022 – Jul 2026 · Remote

Compass is a cloud telephony platform — call routing, IVR, queues — sold to businesses under several whitelabel reseller brands. **Sole frontend developer for four years**, working with product and backend across a distributed, English-speaking team.

Compass Studio — **Next.js administration platform** — [case study](#)

- Developed an early-stage codebase into the production admin suite as its **main author: Next.js, React, TypeScript, Redux Toolkit + RTK Query, Tailwind CSS**.
- Owned the Queues, Prompts and Voicemails domains end to end — API layer, **multi-step wizards**, sortable and filterable tables — which became the patterns the rest of the application was built from.
- Extended a **drag-and-drop call-flow editor** — IVR menus, time-based routing and caller recognition, nested arbitrarily deep — and made it fully **keyboard-operable**.
- Performance:** virtualised long lists and cut redundant requests through targeted RTK Query cache invalidation. Owned EN/NL **internationalisation**.

Compass Bridge — **real-time agent console and WebRTC softphone** — [case study](#) · [live demo](#) (no login)

- Sole developer of a mature **WebRTC/SIP** softphone: registration, audio devices, multi-call state, attended and blind transfer.
- Maintained the **real-time layer**: live users, calls, queues and presence bridged from XMPP into Redux via **RxJS**.
- Built the **call-history subsystem from scratch**, assembling call outcomes client-side from the event stream: transfer detection, deduplication, virtualised scrolling.
- Built the macOS and Windows desktop apps (**Electron**), then drove their retirement once the web client had replaced them.

Centralised sign-in service — **single sign-on (SSO) and multi-factor authentication (MFA)** — [case study](#)

- Designed and built from an empty repository the **sign-in service** both products now delegate authentication to, with every screen designed and reviewed before code.

- **Next.js** app running **OAuth 2.0 / OIDC** flows through **Ory Hydra** and **Ory Kratos**, tokens kept server-side. One deployment serves every reseller brand, themed per hostname; **TOTP two-step verification** with guided enrolment.

Engineering practice

- Migrated **Webpack** → **Vite**, **TSLint** → **ESLint** flat config and class components → hooks, with **Prettier** enforced in CI.
- Wrote **Cypress end-to-end (E2E)** suites and introduced **visual regression testing** with image snapshots. **GitLab CI/CD** with Dockerised builds and tagged releases.

"I worked with Piotr for four years, during which he was responsible for several of our frontend projects and worked very independently. He worked extensively with React and NextJS, and added Cypress into our frontend development process. You can give him responsibility without having to constantly look over his shoulder."

— Maurits de Ruiter, Senior Software Developer, Talksme, Aug 2026

Full-Stack WordPress Developer — agencies and freelance

Jan 2015 – Jun 2022 · Wrocław / Remote

ADHD Interactive (2022) · **eFRESH** (2020–2021) · **Mobile Five Media / HYD Agency** (2019–2020) · **freelance** (2015–2019)

- Built complete **WordPress** sites for agency and direct clients, front to back: custom themes and plugins in **PHP and MySQL**, no page builders, with responsive, pixel-accurate frontends from **Figma, Adobe XD and Photoshop** designs in JavaScript and SCSS.
- Client-side **Vue.js** apps inside CMS sites, such as live race data from a REST API rendered as dense tables that stay readable on a phone; templates and components for .NET sites on **Umbraco** and **Kentico**.
- End-to-end delivery for direct clients — scoping, estimates, build, deployment and support — including e-commerce, performance and cross-browser compatibility.

PROJECT

Recast — full-stack job-application tracker with AI-tailored CVs

2026 · personal project

[case study](#) · [live app](#) (Google sign-in) · [source on GitHub](#)

- Designed and built alone, schema to deployment: **Next.js 16** App Router, **React 19**, **TypeScript**, **PostgreSQL** with **Prisma**, **Auth.js**, server actions and route handlers.
- **Claude API** with streamed structured output typed by Zod schemas: the model selects and condenses entries from an experience library, and every block cites its sources, verified on the server before it is shown.
- **Docker** image built and deployed by **GitHub Actions** to **Google Cloud Run**, with database migrations in the pipeline and keyless Workload Identity Federation instead of stored credentials.
