SUMMARY

Frontend engineer with four years building production React/Next.js applications in TypeScript, as **sole frontend developer** on two live products at a European cloud telephony provider — a Next.js administration platform and a real-time agent console. Owned component architecture, API integration, testing, performance and release. Most of that work was building the same things repeatedly and well: reusable component libraries, multi-step forms, filterable data tables, and the state management behind them, against REST APIs. Eleven years in frontend overall, the earlier part on content-managed platforms in WordPress, Umbraco and Kentico.

KEY SKILLS

Core	TypeScript, JavaScript (ES6+), HTML5, CSS3
Frameworks	React 19, Next.js 16 (App Router), Vue 3, Nuxt
State & Data	Redux Toolkit, RTK Query, REST APIs, normalised state models
Styling	Tailwind CSS, SCSS, CSS custom properties, Material UI, Chakra UI
Testing	Cypress (E2E + visual regression), Vitest, React Testing Library
Build Tools	Vite, Webpack, ESLint (flat config), Prettier, npm
CI/CD	GitLab CI, Docker, tagged releases, Git-based workflows
Performance	List virtualisation, code splitting, bundle analysis, cache invalidation, SSR
Also	Electron, WebRTC/SIP, XMPP, RxJS, OAuth2/OIDC, i18n, Figma
Familiar	GraphQL, Contentful, Strapi, Framer Motion (<i>personal projects</i>)

EXPERIENCE

Frontend Developer — [Talksome](#) Jul 2022 – Jul 2026 · Remote

Compass is a cloud telephony platform — call routing, IVR, queues — serving around 40,000 business users across seven whitelabel reseller brands. Two halves: **Studio** is where administrators build call flows and queues; **Bridge** is where agents work inside them, taking calls and managing queue membership. **Sole frontend developer on both for four years.**

Compass Studio — Next.js administration platform

- Joined an early-stage codebase and developed it into the production admin suite, authoring **169 of 227 source files** as it stands today. **Next.js / React / TypeScript** with **Redux Toolkit + RTK Query** and **Tailwind CSS**.
- Owned the Queues, Prompts and Voicemails domains end to end — REST API layer, RTK Query data slices, **multi-step creation wizards**, and sortable/filterable overview tables. These became the reusable patterns the rest of the application was built from.
- Extended a **visual drag-and-drop call-flow editor**: a recursive branching tree of IVR menus, DTMF input, time-based routing and caller recognition, nested arbitrarily deep and persisted as a single tree against a normalised Redux model. Added queue and prompt configuration, extension selection, time-switch and number-recognition wizards, and reworked the sidebar and element menu.
- Made the editor **keyboard-operable** — tab order through a nested tree, programmatic focus management on insert and delete, and visible focus states throughout, so a call flow can be built without a mouse.
- Implemented **OAuth2/OIDC (PKCE)** authentication on a backend-for-frontend pattern — access token held server-side in an encrypted HttpOnly cookie, never exposed to the browser, with transparent refresh and per-request issuer validation against an allowlist.
- Performance**: virtualised long resource lists, cut redundant network traffic through deliberate RTK Query cache invalidation, and kept the stack current through React 19 and Next.js 16 for the framework-level gains.
- Owned EN/NL **internationalisation** across the application.

Compass Bridge — real-time agent console and WebRTC softphone — try it: bridge.hostedcompass.com → “Show me around” (no login)

- Inherited a mature WebRTC/SIP application and became its sole developer, modernising the stack while extending it into new domains.
- Maintained the **real-time layer**: five live data streams — users, calls, queues, presence — bridged from an XMPP connection model into Redux via **RxJS**, driving live queue state and organisation-wide call visibility.

- Built the **call-history subsystem from scratch** over that event stream. The feature had no server-side counterpart, so call outcomes were assembled client-side: transfer detection, forwarding classification, multi-leg deduplication, ring-time calculation, and virtualised scrolling over large datasets.
- Maintained the **WebRTC/SIP dialer** — registration, audio device enumeration, microphone permissions, multi-call state, attended and blind transfer.
- Built and maintained the **macOS and Windows Store desktop builds** (Electron), then drove their deprecation once usage showed ~99% of users on the web client — removing two release channels and their maintenance cost.

Engineering practice (both applications)

- **Migrated the build from Webpack to Vite**, cutting local dev startup and rebuild times substantially. Working knowledge of both toolchains, including custom plugin configuration and bundle analysis.
- Migrated **TSLint → ESLint flat config**, converted class components to hooks, enforced Prettier in CI.
- Wrote **Cypress E2E suites** for critical paths and introduced **visual regression testing** with image snapshots plus a CI job for snapshot updates — 51 snapshots covering the call-flow editor alone.
- **GitLab CI/CD** with Dockerised builds and tagged releases. Worked directly with product and backend across a distributed team, in English, with designs handed off in Figma.

Frontend Developer — ADHD Interactive

Jan 2022 – Jun 2022 · Wrocław

- Frontend development for **.NET Core content-managed websites** on **Umbraco** and **Kentico** — templates and components for editorially-managed content, from design handoff to production.

“Piotr stood out for reliability and professionalism, and his ideas for improvements increased the product’s value in the client’s eyes. He is self-sufficient, actively takes on new challenges, and delivers on time and to estimate.”

— Patryk Minge, Senior .NET Developer (direct manager), Dec 2022

WordPress Developer — eFRESH

Mar 2020 – Dec 2021 · Wrocław

- Built content-driven WordPress sites from **Adobe XD** designs — responsive, hand-coded themes, no page builders.
- Delivered **GBGB** (Greyhound Board of Great Britain): a content platform where race data is fetched via API and rendered client-side with **Vue.js** — a CMS-managed site with a dynamic data layer. Still live.
- Responsible for performance optimisation, SEO readiness and cross-browser compatibility.

Frontend Developer — Mobile Five Media Ltd (HYD Agency)

Mar 2019 – Mar 2020 · Wrocław

- Frontend development for one of the UK’s larger interactive agencies — custom WordPress themes and templates from agency designs, across a range of client content sites.

Freelance Full-Stack Web Developer

Jan 2015 – Mar 2019 · Wrocław / Remote

- Custom WordPress sites delivered end to end for direct clients — scoping, build, deployment and support, hand-coded in PHP, JavaScript, SCSS and jQuery.
- Built reusable content blocks for **Explain Everything’s** marketing site from supplied Adobe XD designs, letting their team compose pages without a developer. Still live.

EDUCATION

Politechnika Wrocławska — Computer Science and Physics, 2009–2014. Five years completed; no degree awarded.
